PrismView™ Blades

Laryngoscopes With *CONVENTIONAL* Illumination.

End View

The NEW PrismView™ Conventional blades are available in your choice of an American or English Profile. PrismView™ blades may be used: a) when the view of the vocal chords is impaired, especially the most anterior larynx. b) during nasal intubation and c) for post operative examination of the larynx. Both contain an optically polished prism which provides a refraction of 30° without image inversion. To prevent condensation, warm the prism before use by immersing the complete unit in warm water.

English PrismView
